DK1000 DENT KILLER

Dent Pulling Attachment for All UNI-SPOTTER Stud Welders

The **DK1000 Dent Killer** is welded to the panel surface using a UNI-SPOTTER Stud Welder.

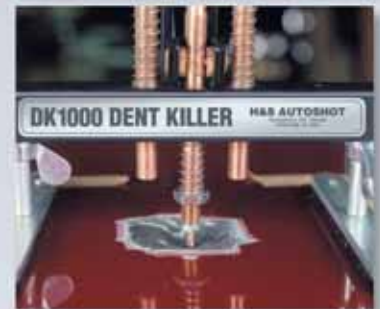

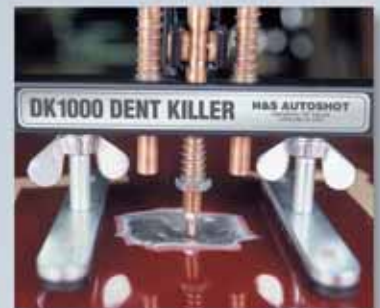

The dent is levered out using only the required amount of pull to leave a flat surface. The Dent Killer is then rotated around the weld to release the electrode, leaving a flat, workable surface.

Larger or longer dents are pulled progressively. Pulling is started at the center of the dent, or the end of a crease.

- Works great to restore body lines
- Works with all **UNI-SPOTTER Stud Welders** (all stud welders work on 110 volts)
- Quick and easy to use
- Lightweight and portable for out-of-position pulls

Smaller dents require only limited grinding of paint. Feet are adjusted closer together for smaller dents, or further apart to accommodate larger dents or body contours.
